Reports Page Proposal

STATUS	OWNER	LAST UPDATED
Proposed	RJTech project	September 6, 2026
Prepared for	RJTech project team	
Prepared by	Codex	
Related files	Reports Page Concept.png; Reports Implementation Plan.md	
Scope	Report functionality, sample interface, data rules, and build milestones	

1 Recommendation

Build Reports as a place to investigate activity, reconcile totals, and export a chosen period. The Dashboard remains a quick overview; Reports adds detailed filters, explicit metric definitions, transaction drilldowns, and downloadable results. Start with Sales Orders, then extend the same layout to five related report areas.

Keep order value, money received, and outstanding balances separate. Each measures a different event or state. Use purchase dates for orders, payment dates for recorded receipts, and a clearly labelled current snapshot for inventory and outstanding balances. This is a design proposal only; no application implementation is included.

2 Scope

Initial release	Later data improvements
Sales Orders, with purchase-date totals and item details	Complete collections ledger including refunds
Recorded installment receipts and current balances	Historical balance snapshots and precise overdue aging
Current inventory, delivery history, customer activity	Stock movement ledger and purchase-cost valuation
Consistent filters, CSV, print, and light or dark mode	Saved presets, native XLSX, and generated PDF

3 Findings from the Current Project

The project already stores checkouts and their item prices, installment contracts and payments, delivery quantities, products, categories, and customers. These records support useful operational reports. However, a completed installment changes its checkout to Paid while retaining the original purchase date, so the existing paid-only Dashboard total is not cash collected during that period.

There is no complete payment ledger for full payments, down payments, and refund payouts. Products hold selling prices, not purchase costs, and inventory has no complete historical movement ledger. Start with reports these records can support and clearly state when a result reflects current status.¹

¹ Current snapshot means the stored state when the report is generated, not the state at a past month end.

4 Sample Design and Report Areas

Figure 1. Reports page concept with fictional sample data. Open the accompanying PNG for full-size inspection; chart values illustrate layout.

Recommended report tabs

Report area	Main question	Date basis	Key output
Sales Orders	What was purchased?	Purchase date	Value, orders, units
Collections	Which receipts were recorded?	Payment date	Installment receipts
Installments	What is still owed?	Current snapshot	Open and overdue plans
Inventory	What needs restocking?	Current snapshot	Stock and reorder list
Deliveries	What stock arrived?	Delivery date	Batches and quantities
Customers	Who purchased in this period?	Purchase date	Customer activity

5 How the Page Works

- a. Choose a report tab. Sales Orders opens with the current month and Paid plus Ongoing orders selected.
- b. Choose a date preset or custom range, then relevant category, payment type, payment method, status, or customer filters. Only show filters supported by that report.
- c. Select Generate Report to apply edits. Reset restores that tab's defaults. Show applied filters, date basis, PHP currency, and the generation time above the results.
- d. Read four summary cards, useful charts, and a detailed table. Search and sort the result; paginate the table while keeping totals over all matching records.
- e. Open an existing checkout, product, delivery, or installment details page from its formatted code or View action. Preserve filters when returning.
- f. Export all matching rows to CSV, or Print a clean report that can be saved as PDF. Export and print use the same applied filters and metric rules as the screen.
- g. Use existing light and dark theme tokens, blue actions, rounded cards, and table spacing. Keep status labels without dots, omit checkboxes and trend columns, and provide keyboard focus, loading, empty, and error states.

6 Implementation Boundaries

- a. Keep report requests read-only. Some installment display services update stored statuses; use dedicated queries and pure overdue calculations instead of invoking those write paths.
- b. Reuse the project's details routes, code formatters, navigation, theme, and table patterns. Support small screens with stacked cards, scrollable tabs, and tables that retain readable columns.
- c. Use a shared report filter model and query service. Project only needed fields, aggregate in SQL, use AsNoTracking, and page detailed rows on the server.
- d. Apply the application's access rules to both previews and exports. Customer contact details are optional columns; ordinary activity reports need only the customer name and reference.
- e. Add XLSX, saved presets, audited refund events, payment reconciliation, cost-based profit, and historical inventory only in later phases with the required records and agreed definitions.

7 Metric and Date Definitions

Rules shared by cards charts tables and exports

Metric	Source	Scope	Calculation or rule
Order Value	Checkout	Purchase period	Sum eligible order totals once; Paid + Ongoing by default
Orders and Units	Checkout items	Same filters	Distinct checkout IDs; sum ItemQuantity
Average Order	Order totals	Same filters	Order Value / Orders; show zero when there are no orders
Recorded Receipts	Installment payments	Payment period	Sum Paid payment amounts; excludes down payments
Outstanding	Installment balance	Current open plans	Sum Balance on eligible open plans; includes contract interest
Inventory Units	Product quantity	Current products	Sum quantities; classify low stock with existing reorder rules
Customer Activity	Checkout customer	Purchase period	Distinct transacting customers; no registration growth metric

Calculation safeguards

- A checkout containing several items counts as one order. Sum item quantities for units and stored CheckoutItem.SubTotal for item revenue; never multiply header totals through an item join.
- A category filter includes only matching item value and units. Count distinct orders containing those items and relabel value columns as Matching Item Value; do not show the whole checkout total as filtered category revenue.
- Keep merchandise order value separate from installment interest and payment receipts. Example: a PHP 10,000 order counts once; a PHP 1,000 later receipt belongs to its payment date. Remaining balance comes from the installment contract.
- Use current product categories as classifications and stored checkout item prices for historical values. Category edits may regroup past sales; preserve category snapshots later if historical classification is required.

Date ranges include the entire selected final day. Confirm how existing DateTime.Now records map to Asia/Manila before adding timezone conversions.

8 Consistency and Historical Limits

Every result must state its date basis and status scope. Current checkout statuses can restate earlier purchase periods after a cancellation or refund. Current inventory and balances are snapshots at generation time; they cannot be labelled month-end historical balances without additional records.

Scenario	Required behavior	Why it matters
Installment completes later	Order stays in its purchase period; receipt uses payment date	Separates sales activity from receipts
Checkout later refunded	Show current status scope; retain recorded receipt history	No refund payout date or reversal ledger exists
Category filter applied	Aggregate matching lines; count each matching order once	Avoids overstated totals
Data changes before export	Requery using applied filters and show a new generation time	Do not imply an immutable report snapshot

9 Acceptance Checks

Check	Expected result	Evidence	Gate
Totals	Cards, charts, table, export reconcile	Known sample dataset	Required
Dates	Final-day and month boundaries included	Boundary records	Required
Payments	No duplicate or missing receipt totals	Partial and completed plans	Required
UI	Readable in both themes and on mobile	Visual review	Required
Read-only	Preview and export change no business rows	Database comparison	Required

Release after the detailed validation cases in the accompanying plan pass. Performance targets should be set against the team's representative dataset.

10 Design Choices

Choice	Benefit	Decision
Extend the Dashboard	Small initial UI change	Use a dedicated Reports page for detailed filters and exports
Copy paid-only sales logic	Matches the current Dashboard	Offer Paid only as an option; default to explicit order activity
Consolidate all cash now	One collections figure	Defer until receipts and reversals have complete dated records
Separate query per export	Quick first implementation	Reuse shared metric and filter logic to prevent drift

11 Implementation Plan

Implement in four reviewable milestones after the design is accepted. Each milestone should reconcile to a small known dataset before adding the next report area. The accompanying implementation plan lists proposed files, detailed rules, and validation cases. No schema migration is needed for the initial read-only scope.

Milestone	Deliverable	Exit criteria
M1 Definitions and shell	Filter rules, Reports navigation, responsive theme-aware layout	Known examples agree with the definitions
M2 Sales and export	Sales Orders, charts, drilldown, CSV and print	All filtered totals and exports reconcile
M3 Related reports	Recorded receipts, balances, inventory, deliveries, customers	Date basis and current-state labels verified
M4 Validation and release	Edge cases, access, performance, mobile and theme review	Acceptance cases pass; proposal scope remains read-only
